

Digital Health Checkup Report

Analysis of Current Physical Report

- **Information Overload:** The current report presents raw data in dense tables (e.g., "Specimen," "Method," "Reference range"). This requires high cognitive effort to process.
- **Lack of Hierarchy:** Critical abnormal results look very similar to normal results. The user has to manually compare their "Result" against the "Reference range".
- **Static Data:** The report is a snapshot in time. It does not show historical trends (e.g., is my cholesterol higher than last year?).

User insights were gathered using an assumption-based research approach, supported by:

- Analysis of existing physical health checkup reports
- Common patient behavior patterns when receiving medical results
- UX best practices for healthcare and data-heavy products

This approach is suitable for early-stage UX exploration and concept validation.

The objective of this user insight research is to understand

- Behaviors
- Motivations
- Emotional states
- unmet needs

of patients who receive health checkup reports, in order to inform the redesign of a digital health checkup report that is **clear, usable, and patient-centered**.

Primary Goal: Redesign the Patient Experience for a General Health Checkup report, ensuring the solution improves patient understanding.

- Patient Information
- Lab Results
- Physician Reports
- Raw Imaging Results

Focuses on a **Mobile-First** Web View, as this is the most accessible channel for patients to **access digital reports** anytime, anywhere.

Primary Users: Patient Individuals who receive health checkup results in digital or physical form.

- Age range: 25–65+
- Medical knowledge: Low to moderate
- Receive reports annually or due to health concerns
- Primary goal is understanding overall health status, not clinical analysis

Secondary Users: Family members assisting with interpretation

The design should **prioritize patients**, not medical professionals.

1. Patients primarily want to know **whether they are healthy or not**, rather than interpret raw medical data.
2. Most users lack medical knowledge and feel **uncertain and anxious** when reviewing health reports.
3. Users scan reports for **abnormal values** instead of reading all details.
4. Clear visual hierarchy and summaries help users understand their health status more quickly and confidently.

1. Reports contain excessive numerical data without prioritization
2. Medical terminology is difficult to understand
3. Lack of clear health summary or overview
4. No clear indication of severity or urgency
5. Unclear next steps after reviewing results
6. Physical report formats do not translate well to digital usage

Patients need a **clear, visual-first digital health report** that highlights important findings, explains results in plain language, and guides them toward appropriate next steps.

Saranya L.

AGE

42

OCCUPATION

Corporate Manager

LOCATION

Urban area

CONTEXT

Receives annual health checkup reports. Reviews results alone on her phone. No medical background.

DECISION TRIGGER

- Seeing a clear “abnormal” indicator
- A risk level (e.g. Low / High)

BACKGROUND

Ananya is a full-time working professional with a busy lifestyle. She receives her health checkup report once a year and reviews it independently before deciding whether to consult a doctor. She does not have medical training and relies on the report to help her understand her current health status.

GOALS

Quickly understand whether her health is normal or needs attention.

KEY BEHAVIOR

- Scans for abnormal / highlighted values
- Skips long medical explanations
- Uses mobile first
- Shares results if unsure

CORE NEEDS

- Instant health summary
- Clear abnormal highlights
- Simple language

PAIN POINTS

- Too many numbers, no clear priority
- Medical terms are confusing
- No clear health summary
- Anxiety from unexplained “abnormal” results

GUIDING QUOTE

“Just tell me if I'm okay and what to do if I'm not.”

INFO		SCENARIO		EXPECTATION			
NAME	Saranya L.	Saranya receives her annual health checkup report digitally. After work, she opens the report on her mobile phone at home to quickly understand whether her health is normal or requires medical attention. She reviews the report alone before deciding whether to consult a doctor.		- Instantly know if her health status is normal or abnormal - Clearly see what needs attention - Understand results without medical knowledge - Know what action to take next			
AGE	42						
OCCUPATION	Corporate Manager						
GOAL	Understand whether his health is normal and if follow-up care is needed						
Journey Stage		Receive Report	Health Overview	Scan for Abnormal Values	Interpretation	Decision Making	Save & Follow up
Actions		- Receives notification - Opens report on mobile	- Views first screen - Looks for summary	- Scrolls through results - Focuses on highlighted	- Taps read explanations - Compares values with reference ranges	- Reviews recommendations - Decides to seek medical advice	- Saves or shares the report - Refers back to it later
Expectations		"Are my results okay?"	"Am I generally healthy?"	"What's wrong?" "How serious is this?"	"What does this mean in simple terms?"	"Do I need to see a doctor?"	"I understand my health better now."
Pain Points		Anxiety before seeing results	- No clear health overview - Raw data shown early	- Too many numbers - No severity level	- Medical jargon - Confusing numerical	- No clear next steps - Unclear urgency	Difficult to track changes over time
Emotion		☹️	☹️	☹️	☹️ → 😊	😊	😊
Opportunities		- Clear - Reassuring notification - Intro screen	High-level health status (Normal / Needs Attention)	- Group abnormalities - Color-coded severity	- Simple explanations - Visual comparisons	Action oriented recommendations (Low / High risk)	- History view - Trend visualization
